Tuesday, 22.9.: Semiconductors (Chair: J. Wrachtrup, F. Jelezko)

Speakers:

D. Yakovlev, Dortmund
P. Michler et al., Stuttgart
F. Jelezko, Stuttgart

Topics:

The session deals with the spin physics of semiconductors as well as the spin photon and photon exciton interaction in semiconductor nanostructures. Engineering the light matter interaction by photonic structures as well as coupling among semiconductor nanostructures will be discussed. Materials comprise defects in diamond as well as quantum wells and quantum dots.

Speakers:

Antoine Browaeys, Paris
Johannes Hecker-Denschlag, Ulm
Claus Zimmermann, Tübingen

Topics:

The session includes tutorials on: Trapping of single atoms, single interacting Rydberg atoms, formation of molecules from atoms in lattices, spectroscopy of molecules and its applications, and a selection from the following issues: Bose-Einstein condensate and atomic quantum gas, optical lattice and energy bands, Mott insulator and Bose-Hubbard model, double well potential and number squeezing with cold atoms, Bragg and Ramsey spectroscopy with cold atoms
